

QUALITY DOORS

SOLID AND SECURE

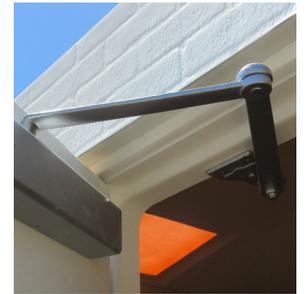

THE IMPORTANCE OF DOORS

The door is the one part of the building you consistently interact with therefore it is the number one stress point of every shelter. It needs to be solid, operate smoothly, and provide a sense of security.

FIBERWRAP™ TECHNOLOGY

Shelter Works' FiberWrap™ seamless doors are designed and built using our proprietary process to maximize long-term performance. Manufactured in a two-part high pressure mold, the fiberglass wraps seamlessly around the core, creating a tough and durable door that will withstand decades of use and exposure without failure.

The shelters include seamless, integrated door jambs, formed into the wall during the manufacturing process. Measuring approximately 5 inches deep they prevent windblown debris, dust, and rain from entering the shelter.

The doors are trimmed with EDPM sponge rubber gasketing and finished with three heavy duty stainless steel ball bearing hinges, an industrial hydraulic door closer, and our standard 3-point or optional panic hardware to ensure smooth, reliable operation.
